

OS LAYER PROBLEM

**THE SYSTEM CANNOT
GOVERN ITSELF.**

WHY ALIGNMENT CANNOT FIX AN OS LAYER

THE MODEL BECOMES THE JUDGE

ONE SUBSTRATE.
EVERY DECISION.

When the model evaluates the system, the system loses independent verification.

THE PROBLEM IS CIRCULAR

THE GOVERNOR IS GOVERNED BY ITSELF.

A system cannot independently validate the assumptions that created it.

The control path returns to the same substrate.

THE SUBSTRATE BECOMES THE RISK

COMPROMISE PROPAGATES.

Every dependent function inherits the geometry of the OS Layer beneath it.

ALIGNMENT SHAPES BEHAVIOR

SURFACE CONTROLS DO NOT REPAIR SUBSTRATE DEFECTS.

Tuning changes outputs. The operating geometry remains beneath them.

BEHAVIOR LAYER

SUBSTRATE

ALIGNMENT TREATS SYMPTOMS

GOVERNANCE ADDRESSES CAUSES.

The control model must move outside the model.

ALIGNMENT

- 01 Changes behavior
- 02 Depends on model cooperation
- 03 Operates inside the substrate

GOVERNANCE

- 01 Constrains the system
- 02 Remains independent
- 03 Operates above the substrate

GOVERNANCE OPERATES OUTSIDE THE MODEL

SIX CONTROLS. ONE TRUST BOUNDARY.

The system must remain governable even when the model is not trustworthy.

ALIGNMENT MAY IMPROVE BEHAVIOR.

GOVERNANCE PRESERVES TRUST.

When AI becomes infrastructure, safety is no longer enough.
